把你自己的lib先备份一下

同时更新一下universe下面的mcore.h

要用这个库的时候把mcore.h的69行的if 0改为if1

```
/*!
func    mmem_debug_check
\brief  check memory or print used state
\param  flag[in]            0x00000001 : check overflow
                            0x00000002 : print statistic just active lines
                            0x00000004 : print statistic all lines
                            0x00000008 : print detail, every line nodes
\return void
*/
void mmem_debug_check(unsigned long flag)
```
